Research interests

My research addresses two basic aspects of children's cognitive development: (1) their beliefs about the nature of reality, and (2) their understanding of mental states and processes. My studies of children's understanding of various realities and non-realities have probed children's ability to distinguish reality from appearance, the concept of invisibility, their use of natural versus supernatural explanations, and their understanding of the fantasy/reality distinction. Research I have conducted on children's understanding of mind addresses children's understanding of the mental nature and origin of beliefs, desires, dreams, imagination, and pretense, and their understanding of human behavior as a function of these mental states.
